

SCREEN

Printing

In the Screen Printing process a screen is made up of a metal frame with fine gauze tightly stretched over it. The gauze is covered with a light-sensitive coating, into which the logo is burned.

Ink is pushed through the screen by a squeegee and only transfers where the logo was burned.

Screen Printing provides excellent coverage and is especially good for large and bold logos; it is widely employed for printing:-

Bags,

Folders,

Umbrellas

T-shirts.
